AMD ACT III · REINVENT COMMERCE

CommerceOS

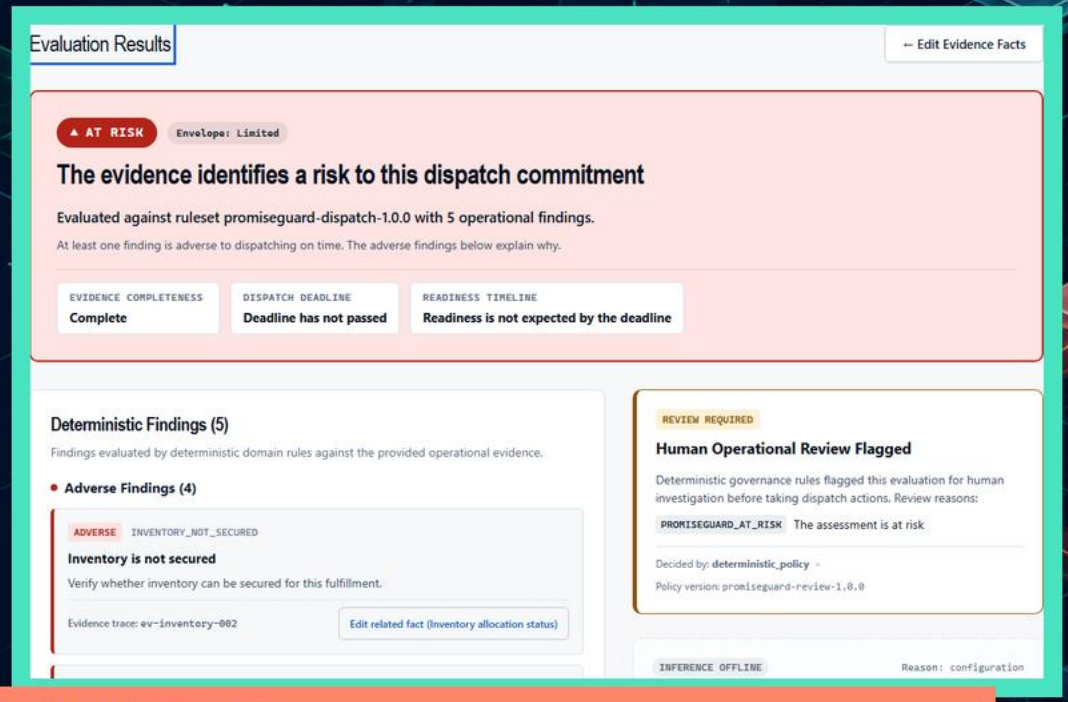

Rule-first commerce intelligence.

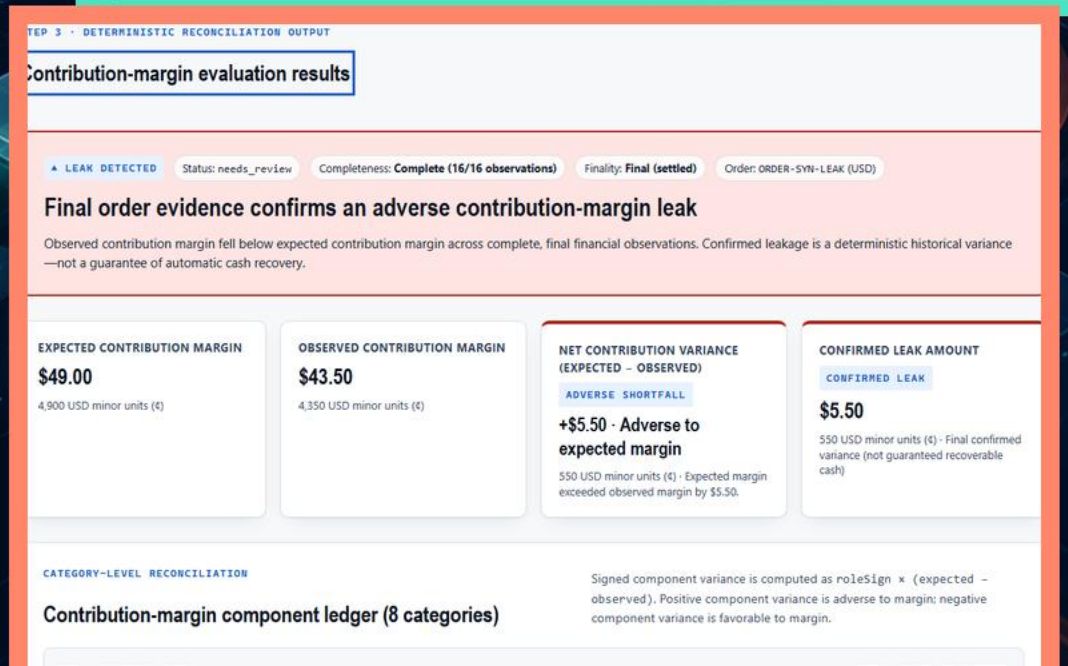

Dispatch readiness · Margin variance · Human review

PROMISEGUARD MARGINLEAK

Deterministic verdicts. Exact minor-unit math.
Evidence-linked findings. Fail-closed AI boundary.

Synthetic prototype · Live AMD inference pending entitlement

Commerce failures are discovered too late

Dashboards report outcomes; generic assistants can explain without owning evidence quality or arithmetic.

Silent promise risk

Inventory, blockers, and readiness estimates drift apart until a dispatch cutoff is missed.

Hidden margin variance

Revenue and cost movements offset each other, while provisional or missing facts create false confidence.

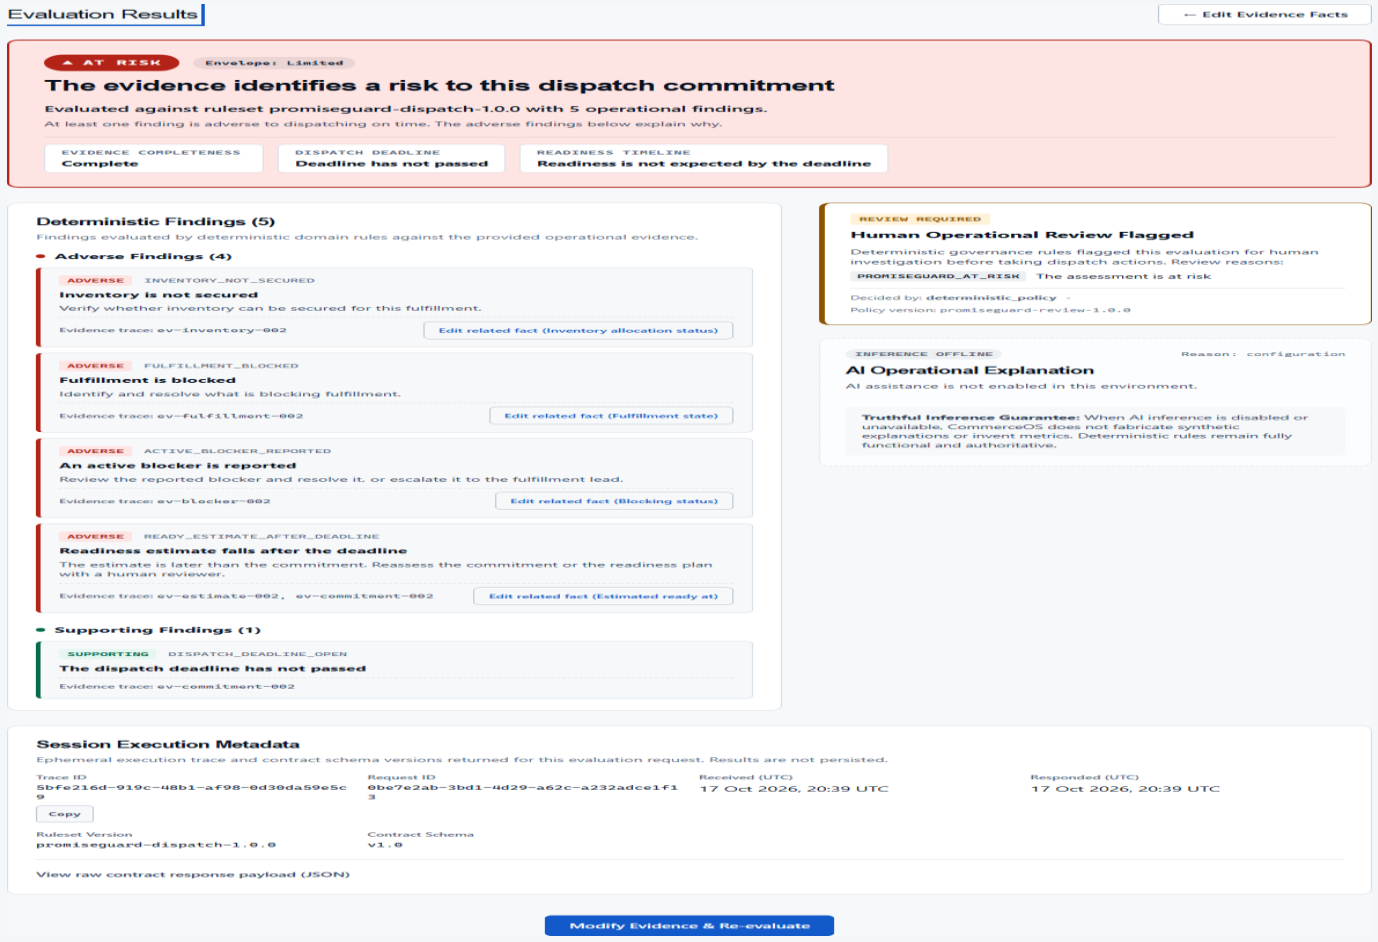

Opaque automation

An AI answer cannot be the source of truth for a customer promise, a financial number, or a review decision.

CommerceOS turns evidence into a deterministic decision first—then permits only bounded, optional advisory AI.

PromiseGuard: dispatch readiness with evidence

Functional synthetic preview · capability registry remains stub

3 truthful outcomes

Supported · At risk · Indeterminate

Traceable findings

Every rule points to the evidence that triggered it.

Human review

Risk or insufficient evidence produces explicit review reasons.

AI is offline in this proof. The deterministic result remains complete.

MarginLeak: exact variance without invented money

Development-only synthetic preview · capability registry remains planned

$49.00

expected contribution margin

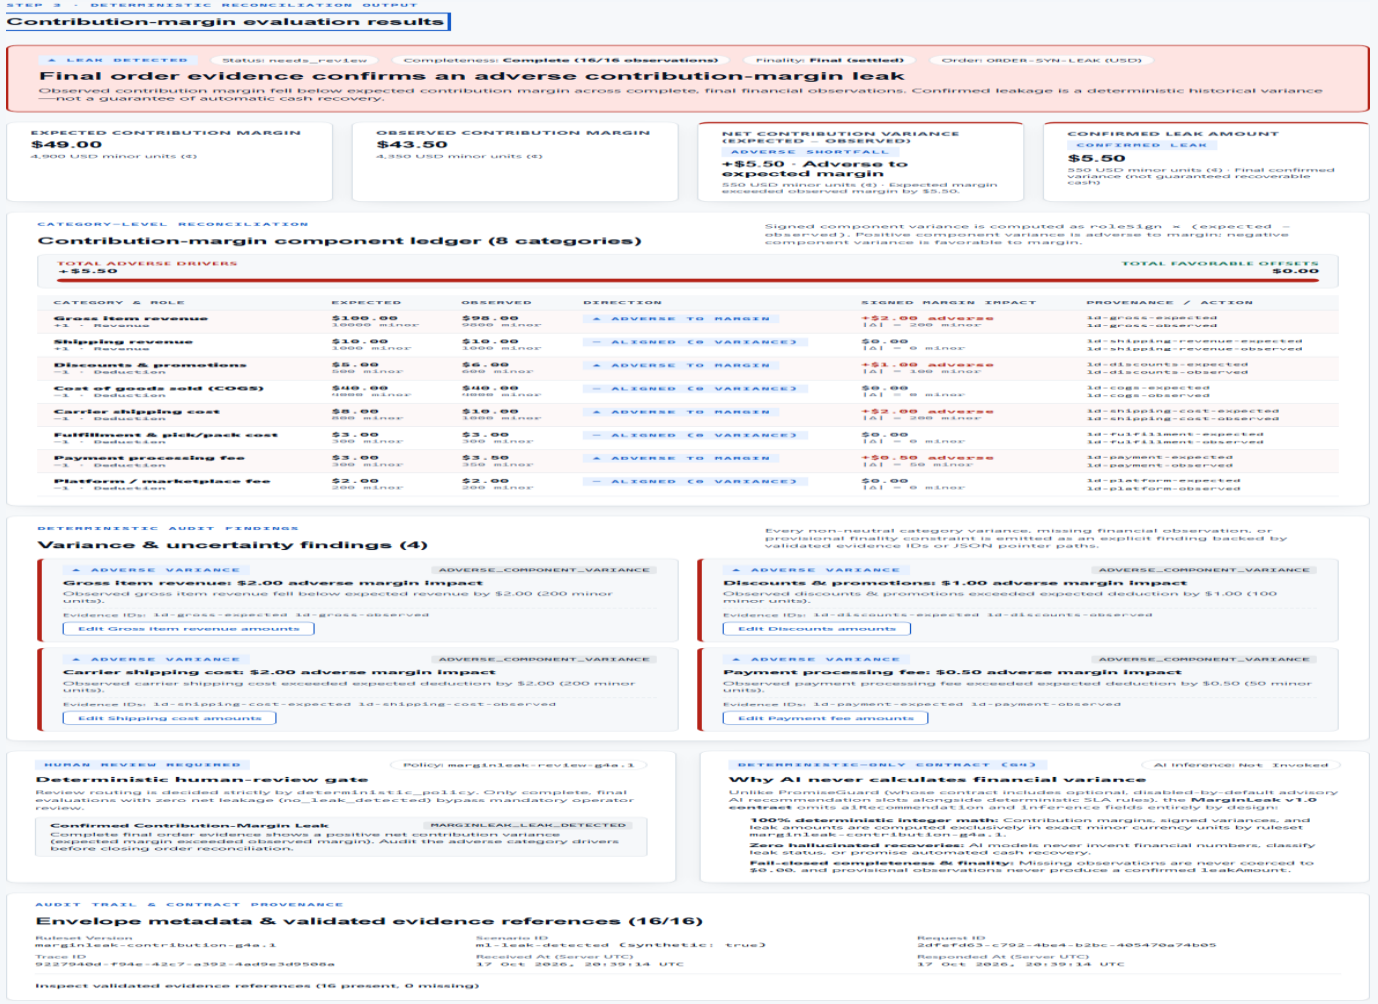

$43.50

observed contribution margin

+$5.50 adverse

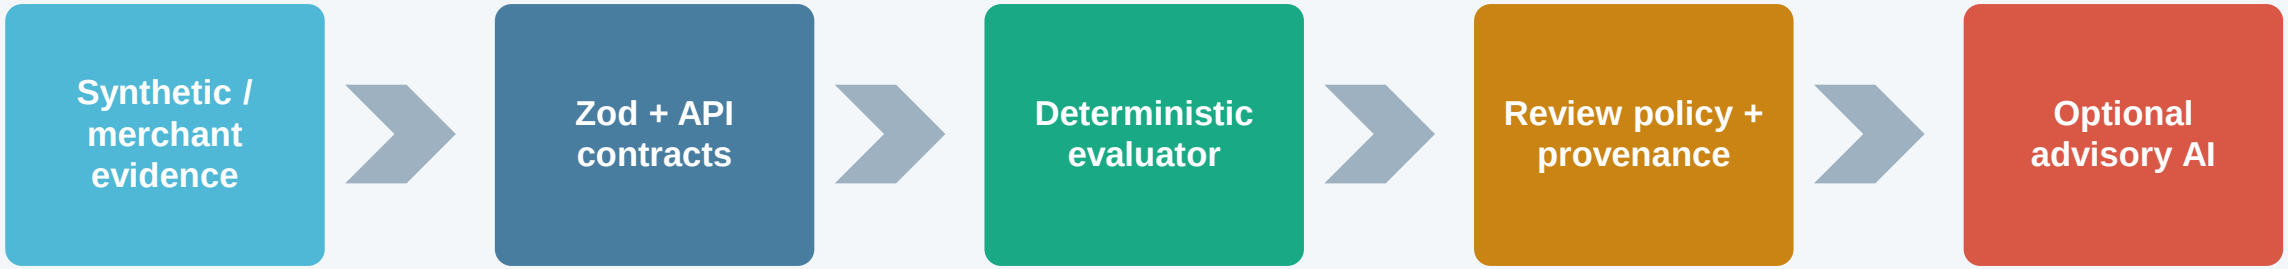

confirmed variance · human review required

Integer minor-unit arithmetic · 8-category ledger · missing totals withheld

One contract-first decision path

The model boundary is downstream of deterministic truth—not in charge of it.

Verdicts stay deterministic

AI cannot mark a risky order supported.

Money stays deterministic

AI cannot calculate or invent leak amounts.

Failure stays visible

No silent live-to-mock fallback.

Fail closed by design

Prototype honesty is a product feature.

Incomplete evidence

PromiseGuard returns indeterminate; MarginLeak withholds totals.

Provisional observations

Adverse variance is visible, but confirmed leakage remains unavailable.

Provider unavailable

Deterministic analysis completes; AI state reports unavailable.

Production MarginLeak

Page returns 404 and analysis API returns 403.

Secrets

Server-only variables, repository scanner, no credentials in assets.

Capability truth

PromiseGuard stub · MarginLeak planned · RescueCart disabled.

No live AMD inference is claimed without an authenticated request and generated response.

Verified on the release baseline

Private source f13f7de · public release 3075513 · automated checks from Mission 017

205
unit tests passed

18
production E2E passed

8
MarginLeak viewport widths

173
public files scanned

Build

Next.js production build passed.

Security

No recognized secrets; no known high vulnerabilities.

Browser gates

Production 404/403 restrictions verified.

MIT-licensed public release and production deployment verified on October 18, 2026.

Ready to submit truthfully

The public release is live. AMD entitlement and the operator's final Submit action remain unresolved.

Published

MIT source · public repository · Vercel deployment · cover · slides/PDF · authentic video

Operator action

Review the completed event form and perform the reserved final Submit action.

External dependency

Organizer must map the approved account to Token Factory API-key distribution.
